

SuDTV Cheat Sheet

Overview

This guide covers the basic tools needed for the DTV course:

- Android SDK and ADB usage
- Cuttlefish (emulator) usage
- Installing Comedia service
- Pushing files on to the target device

Setup

To use Android tools you first need to source or export Android SDK to the PATH.

Exporting Android SDK is done with next commands (needs to be done on every terminal instance):

```
export ANDROID_HOME=/home/nituser/Android/Sdk  
  
export PATH=$PATH:$ANDROID_HOME/platform-tools
```

ADB Basics

ADB (Android Debug Bridge) is used to communicate with the Android devices.

Source: <https://developer.android.com/tools/adb>

Connect to device:

```
adb connect <IP>:<PORT> (in our case port is 6520)
```

Listing connected devices:

```
adb devices
```

Giving root privileges to device:

```
adb root
```

Remounting filesystem to r/w (read/write):

```
adb remount
```

Installing apk with adb:

```
adb install <path-to-apk>
```

Pushing files on target devices:

```
adb push <local-path> <target-device-path>
```

Seeing logs:

```
adb logcat
```

Tips and tricks:

If you don't have any emulator devices shown on the <https://<IP>:8443> on the browser and you can't connect to the device via adb then do the next steps on the computer where docker is running:

```
docker restart cvd_server
```

You can connect to the other computer via ssh:

```
ssh nituser@<pc-name or ip>
```
